

Evidence before milestone decisions.

Milestone Relay Evidence Registry - verifiable cross-chain records with Attestcoin.

THE PROBLEM

Milestone decisions depend on fragmented evidence. Teams need a durable record that exact cross-chain evidence exists and has not been reused.

THE CURRENT BUILD

A Solidity evidence registry with immutable owner commitments, native Attestcoin proof verification and persistent replay protection. The proof path is real; the registry is locally tested.

Product status: implemented locally; awaiting registry testnet deployment and its real state-transition receipt. No public wallet, deployment or transaction was performed.

Source bytes, proof, verification.

Exact binding prevents unverified RPC fields from becoming trusted policy evidence.

01 / READ AND SELECT

Read a pinned existing public Sepolia transaction. Confirm chain 11155111 and a successful receipt.

02 / GENERATE AND BIND

Get the official Merkle/continuity proof. Re-encode the transaction and receipt with the SDK; require byte-for-byte equality.

03 / VERIFY AND ADMIT

Use the Creditcoin testnet verifier precompile at 0x0FD2 through `eth_call`. Admit only after true; reject duplicate admission within one process.

A positive result and a negative test.

Saved observation: 2026-09-06T21:30:05.961Z

Official proof verification	PASS / native verifier static call
One-byte modification	REJECTED / Merkle proof validation failed
Source transaction status	SUCCESS / bound to the verified bytes
Repeated evidence ID	REJECTED / current process only
Source / destination blocks	Sepolia 11649780 / CC3 5442683
Wallets / signed transactions / assets moved	0 / 0 / 0

Public benchmark tx: 0x94971d0d11d401a8868118d5735db920095833b66c4f588e810171329c6abb4c

Three replay journeys. One honest boundary.

OFFLINE PRODUCT MODEL

Approved milestone release; rejection with dispute and refund; timeout with dispute and refund. Simulated units are conserved and event order is enforced.

CORE MVP / STATEFUL EVIDENCE REGISTRY

A nonpayable Solidity registry calls the native verifier and persists exact owner-selected evidence with global replay protection. It is compiled and tested with a local mock. Public testnet deployment is the remaining implementation gate.

The official event requires testnet deployment and Attestcoin as a core feature. The public benchmark does not prove work completion. Financial settlement is outside this MVP; acceptance and submission remain unclaimed.

Evidence that another builder can check.

LOCAL COMMANDS

`pnpm install --frozen-lockfile; pnpm test; pnpm verify:attestcoin; pnpm compile:contract.`

WHAT TO INSPECT

The saved verification receipt, complete proof, explicit benchmark policy, source code, negative tests and captioned video are included in the review bundle.
